The DRAM Vol. 17(8) - The role of microaggressions against the LGBTQ+ community in young adult bisexual+ women's alcohol use

While [stigma](#) against the LGBTQ+ community has decreased in recent years, at least in the United States and other parts of the world, it still persists and impacts members of the community. Sometimes this takes the form of [microaggressions](#): comments or actions that discreetly show prejudice towards the marginalized community. Microaggressions [cause psychological distress](#) and can lead to [unhealthy coping mechanisms](#), such as drinking. This week, The DRAM reviews [a study by Sarah Ehlike and colleagues](#) that examined the role of microaggressions on bisexual+ women's daily drinking behavior and the consequences of this drinking.

What was the research question?

How are microaggressions related to the drinking behavior of bisexual+ women?

What did the researchers do?

The researchers recruited women from online sources such as Facebook, Reddit, and Tumblr. To be included in this study, participants had to be [cisgender](#) females, bisexual+¹, 18 to 25 years old, have reported at least one instance of alcohol use a week for the past 30 days, have had at least two [binge drinking](#) episodes over the past 30 days, and reported at least one microaggression against their sexual identity a week over the past 30 days. These criteria led to a final [sample](#) of 103 bi+ women. The researchers emailed these participants daily surveys that included questions about the previous day's experiences of microaggressions, alcohol use, and consequences of that alcohol use. The researchers listed nine microaggressions, which included feeling excluded from social situations due to sexuality or having someone assume one's sexuality. Because individual differences could also impact alcohol use in this study, the researchers used [multilevel models](#) to assess the role of microaggressions.

What did they find?

The majority of the sample were white students who identified as bisexual. Participants reported drinking on 46% of the days and experiencing at least one microaggression on 41% of the days. On days when participants experienced microaggressions, they were more likely to report drinking, consuming more alcohol, and suffering more alcohol-related consequences.²

Figure. The number of microaggressions on drinking days (mean = 0.91) compared to the number of microaggressions participants faced on non drinking days (mean = 0.54). Click image to enlarge.

Why do these findings matter?

These findings suggest that microaggressions can have negative health consequences among those in the LGBTQ+ community. This study helps us understand why [alcohol dependence and misuse are higher in the LGBTQ+ community](#). It also provides evidence of the need for culturally tailored interventions for LGBTQ+ individuals who may have a drinking problem. Such interventions might help LGBTQ+ individuals find healthier ways to cope with [minority stress](#). Future studies might explore the best ways to challenge the beliefs and attitudes that give rise to microaggressions in the first place.

Every study has limitations. What are the limitations in this study?

This study had relatively narrow exclusion criteria, particularly in how participants needed to report at least two binge drinking episodes over the previous 30 days and had to experience at least one microaggression a week over the previous 30 days. Because of how the researchers selected the sample, the results might not apply to the bisexual+ population more broadly. Another large limitation of this study was its reliance on [convenience sampling](#), which relies on participants to come to the researchers and thus may bias the sample towards more motivated individuals.

[1] Bisexual+ refers to anyone attracted to more than one gender or anyone for whom gender does not matter. The bisexual+ community includes people who identify as bisexual, pansexual, or sexually fluid among others.

[2] Elkhe and colleagues controlled for weekend days, aggregate levels of microaggressions, ethnicity, and relationship status.
